Dr. Collins, you said: "This picture ... will ultimately advance understanding of brain diseases like epilepsy, schizophrenia, autism, and Alzheimer's disease".

You used the word "will". Humans are not God. What types of evidences could support this "will" ?

Observation of activities sometimes could be misleading. Such as humans based on Earth noticed that Earth is at rest, but the Sun is moving which led to the geocentric model.

Also I notice in the advocacy of Brain Activity Map project, an analogy with Human Genome project is repeatedly talked. The theories and experiments of genes were already very mature when Human Genome project started.

However, little is known about the functional principles of brains and the main brain functionality intelligence so far. Is this analogy misleading ?
